

PartB machine-learning flow: baseline eCRF → incident mobility-limitation trajectory class

*LCGM/GMM fitted for class enumeration; GMM gave non-positive-definite (Heywood/boundary) solutions, so LCGA was retained (CHARLS 3 / ELSA 3 / HRS 2 classes). Trajectory built on the 70% training set only; the 30% test set was assigned by posterior probabilities (no leakage). A single model (Random Forest) suffices for a single continuous predictor (eCRF); no 1000× repetition was done.
